HISTORY

It's a stomp board! Not a lot else to it, it'll make your wiring tidier and your builds more heroic.

It will also fit into a 1590A. Another couple of features, useful in multi builds are the power pads on both sides and the option of input and output pull down resistor in case you need it.

It comes in a panelized package of 3, to separate them; use flat cutters cut in the middle of joint, then remove the excess to your taste without cutting into the ground planes and traces.
